Fintech Growth Analytics: Executive Summary

Customer acquisition, funnel, retention, campaigns and support | Prepared by Yash Sharma | Snapshot 2026-10-31

SYNTHETIC DATA: fictional dataset of 10,000 users (Nov 2025 - Oct 2026, INR). Not real customer, company or market data. No revenue, profit or ROI is calculated. Portfolio project, not professional brokerage work.

70.5%	38.0%	56.0%	23 days	Rs 331
Registered -> KYC	Registered -> first trade	M3 retention	Median reg. -> first trade	Blended paid CAC

Headline KPIs: mature cohorts (registered before Oct 2026, n=9,116). ACTUAL values calculated from the synthetic data.

The five most important findings

- **KYC drives the largest loss.** KYC is the largest leak. Only 70.5% of registrants complete KYC; 2,687 users are lost there (42.6% of all stage losses).
- **Few registrants reach a first trade.** Only 38.0% of registrants place a first trade. Deposit (76.9% of bank-linked users) and first trade (79.8% of depositors) leak a further 2,183 users.
- **Referral beats paid on quality and cost.** Referral is the strongest channel: first-trade rate 52.9% and cost per first trader Rs 438, against Rs 1,216 for Finance Affiliate and Rs 1,252 for Video Awareness, the two weakest paid campaigns.
- **Retention decays steadily.** Retention decays steadily: 67.6% at M1, 56.0% at M3, 40.7% at M6. Referral and organic cohorts retain best (M3 61.2% and 60.4%); partnerships worst (50.8%).
- **Support load sits in onboarding.** Support load is concentrated in onboarding: KYC, bank-link and deposit tickets are 54.8% of 7,614 tickets; priority does not change resolution time and 563 unresolved tickets are older than 90 days.

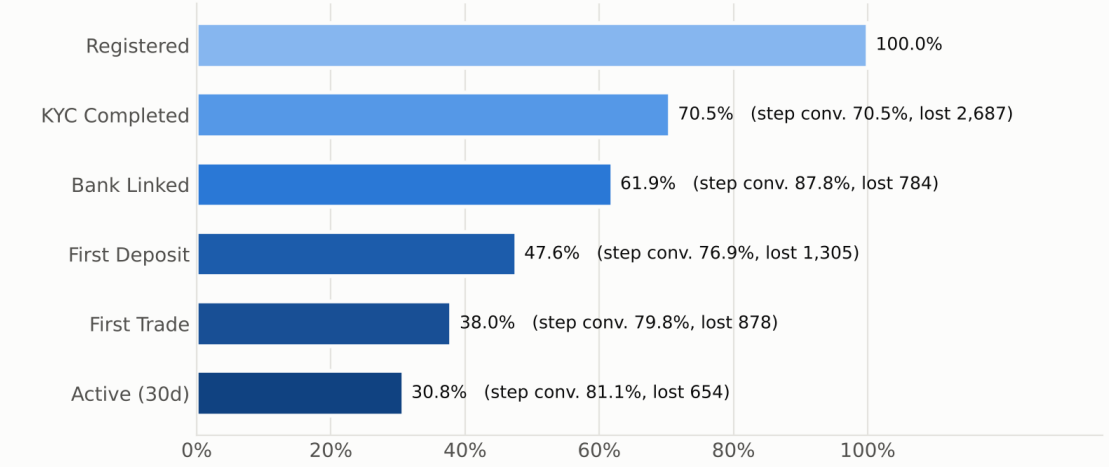

Priorities (recommendations, not results)

- **1.** Use cost per first trader (not CAC) as the primary campaign KPI in budget reviews. [impact High, complexity Low, Immediate]
- **2.** Scale the referral programme with a post-first-trade prompt (EXP-06) while monitoring referred-user quality. [impact High, complexity Low, 1-3 months]
- **3.** Re-allocate part of the CMP04/CMP06 budget to CMP05/CMP10 in stages, measuring marginal cost. [impact Medium, complexity Low, 1-2 months]
- **4.** Reconcile funnel flags with the activity log (source-of-truth rules) before any segment-level targeting. [impact High, complexity Medium, 1-2 months]
- **5.** Add a stage-specific reminder cadence for stalled users (KYC, bank, deposit, first trade). [impact High, complexity Medium, 1-2 months]
- **6.** Report M3 retention per channel quarterly and include it in the scorecard. [impact Medium, complexity Low, Immediate]

Funnel and campaign efficiency

Only 38% of registrants place a first trade; KYC is the largest leak

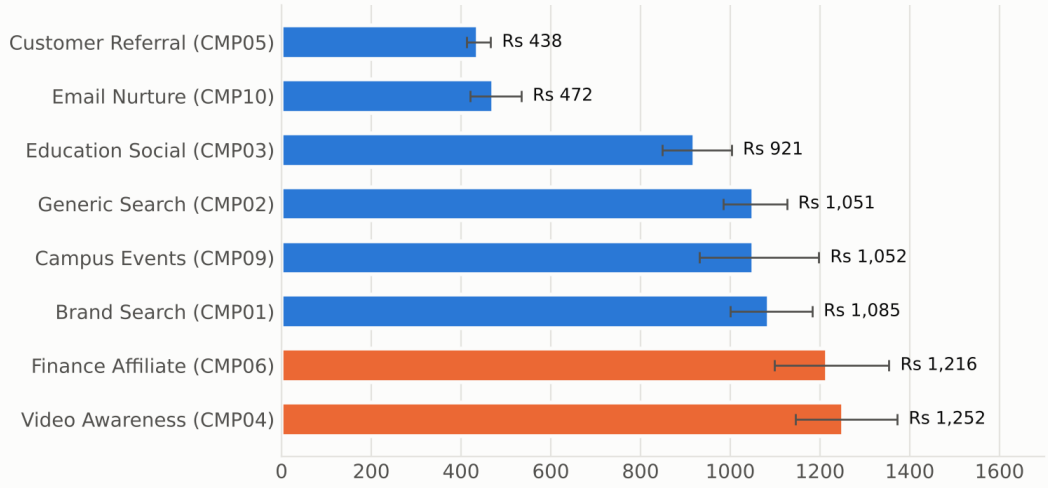

Share of 9,116 mature registrants reaching each stage (cumulative), with step conversion and users lost

Source: synthetic dataset (10,000 users, Nov 2025 - Oct 2026). Mature cohorts unless stated.

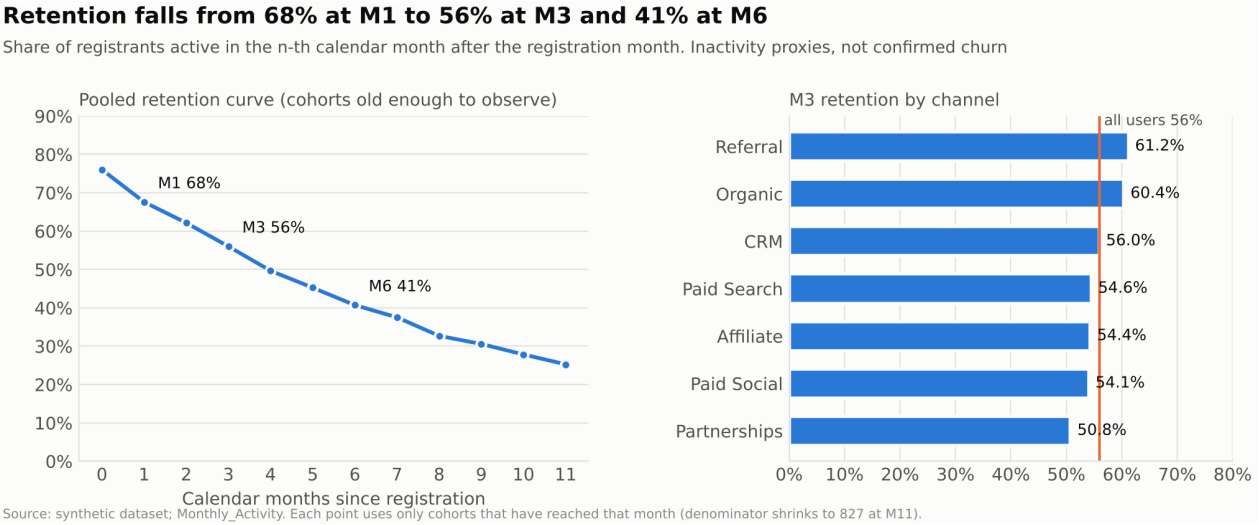

Referral costs about a third of the weakest campaigns per first trader

Cost per first trader at maturity (Rs) = CAC / first-trade rate; orange = tier C (CMP04, CMP06); whiskers = 95% interval

Source: synthetic dataset; spend is recorded campaign spend. Organic has no recorded spend and is excluded (CAC not defined). No revenue/ROI is calculated.

Retention

Proposed experiments

Ten experiments are proposed (guided KYC, assisted KYC, UPI-first bank link, quick-amount deposit, guided first trade, referral prompt, habit nudges, KYC status tracker, win-back, paid-social pre-qualification page). None has been run; baselines are actual, effect sizes are assumptions, and the traffic constraint (about 190 registrations a week) makes retention and paid-social tests slow. See Growth_Experiments.xlsx.

Limitations

- Synthetic data: patterns reflect how the dataset was generated (for example, ticket priority has no effect on resolution time).
- Funnel flags and the monthly activity log disagree for many users (91-98% in stalled segments), so segment sizes are indicative.
- Inactivity flags are proxies, not churn; recent cohorts are excluded or eligibility-limited; ticket, early-trading and channel patterns are associations, not causal effects.
- No revenue or cost-to-serve data: cost per first trader is a cost metric, not ROI. K-means (silhouette 0.33) and the early-warning model (AUC about 0.57) are descriptive only.
